

# Spanish Wine Quality

By: Jonathan N Hernandez

# Project Description

- The goal is to help find the quality of red wine from Spain.
- The Stakeholders are the wine companies in Spain and the consumers.

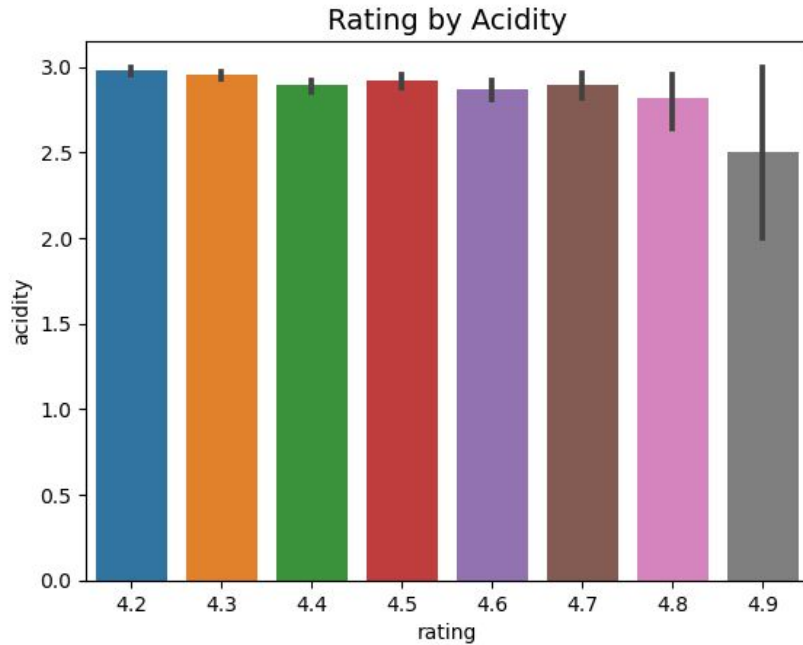

# Wine Dataset

- The [dataset](#)(from Kaggle) describes several popularity and description metrics their effect on it's quality.
- I will be using the rating(from 0 to 5) to help determine the quality of the wine. This is a classification problem.

# Data Visuals

# Best Model

- Best production model is the PCA Logistic Regression model due to 4.3 being the highest at .78.
- 4.2 being .69 is still a good point since we saw the prices matching this rating is a more budget friendly to try new wines.
